Take Home Project

Avenir Interactive Take-home project

Description

- Build a website that queries reddit's API for images and displays them beneath the search input in a tile-able fashion (like Pinterest)
- When the user gets close to the end of page newer images should load, creating an "infinite" list of images

Requirements

- The website should be responsive
- The user should be able to search for images containing specify terms (e.g. cats) and that should fetch pictures of cat from reddit. Have a text field at the top of the page that accepts user input and sends the search
- When there is no input in the search input box - load the hottest images for the sub-reddit

Nice to have

- Fixed search bar at the top
- Wait till the user is done typing before making the search query to reddit
- Use a framework like Angular, React, Backbone
- Deploy it to Heroku (or anywhere else) if you have time

References

- Reddit API docs: https://www.reddit.com/dev/api
- /r/pics is a good sub-reddit for getting images
